Project Planning Phase

Planning Logic

Date	28 February 2026
Team ID	LTVIP2026TMIDS74439
Project Name	OrderOnTheGo: Your On-Demand Food Ordering Solution

Data Collection

- Collect user registration data (Name, Email, Location, Contact).
- Gather restaurant information (Name, Category, Address, Menu Items).
- Capture product details (Food Name, Price, Category, Availability).
- Store order transactions (User ID, Product ID, Quantity, Order Date, Payment Mode).
- Collect customer feedback (Ratings and Reviews).
- Store all data securely in MongoDB database.
- Ensure structured schema design using Mongoose models.

Data Cleaning (Data Pre-processing)

- Remove duplicate user and order records.
- Validate email formats and phone numbers.
- Encrypt user passwords using secure hashing.
- Handle missing or null values.
- Standardize pricing format and currency.
- Validate food categories and availability status.
- Remove invalid or cancelled order entries.
- Implement backend validation middleware for data integrity.

Exploratory Data Analysis (EDA)

- Identify popular food items and categories.
- Analyze peak order times.
- Calculate average order value.

Univariate Analysis

- Total users and orders.
- Price distribution.
- Rating distribution.

Bivariate Analysis

- Price vs Order frequency.
- Rating vs Sales.
- Category vs Revenue.

Descriptive Analysis

- Total revenue generated.
- Top-selling items.
- Best-performing restaurants.

SB Foods collects user and restaurant data, cleans and validates it, analyzes ordering patterns using EDA techniques, performs univariate and bivariate analysis to understand trends, and uses descriptive analytics to support business decisions. The system is implemented using MERN stack with scalable cloud deployment.
